Abstract. A graph is called supermagic if there is a labeling of edges, where all edges are differently labeled with consecutive positive integers such that the sum of the labels of all edges, which are incident to each vertex of this graph, is a constant. A graph $G$ is called degree-magic if all edges can be labeled by integers $1, 2, \ldots, |E(G)|$ so that the sum of the labels of the edges which are incident to any vertex $v$ is equal to $(1 + |E(G)|)\deg(v)/2$. Degree-magic graphs extend supermagic regular graphs. In this paper, the necessary and sufficient conditions for the existence of degree-magic labelings of graphs obtained by taking the join and composition of complete tripartite graphs are found.

Keywords. Tripartite graph; Supermagic graph; Degree-magic graph; Balanced degree-magic graph

1. Introduction

Consider simple graphs without isolated vertices. If $G$ is a graph, then $V(G)$ and $E(G)$ stand for the vertex set and the edge set of $G$, respectively. Cardinalities of these sets are called the order and size of $G$.

Let a graph $G$ and a mapping $f$ from $E(G)$ into positive integers be given. The \textit{index mapping} of $f$ is the mapping $f^*$ from $V(G)$ into positive integers defined by

$$f^*(v) = \sum_{e \in E(G)} \eta(v, e)f(e) \quad \text{for every } v \in V(G),$$

where $\eta(v, e)$ is equal to 1 when $e$ is an edge incident with a vertex $v$, and 0 otherwise. An injective mapping $f$ from $E(G)$ into positive integers is called a \textit{magic labeling} of $G$ for an index $\lambda$ if its index mapping $f^*$ satisfies

$$f^*(v) = \lambda \quad \text{for all } v \in V(G).$$

A magic labeling $f$ of a graph $G$ is called a \textit{supermagic labeling} if the set $\{f(e) : e \in E(G)\}$ consists of consecutive positive integers. A graph $G$ is \textit{supermagic (magic)} whenever a supermagic (magic) labeling of $G$ exists.

A bijective mapping $f$ from $E(G)$ into $\{1, 2, \ldots, |E(G)|\}$ is called a \textit{degree-magic labeling} of $G$ if its index mapping $f^*$ satisfies

$$f^*(v) = 1 + |E(G)| \deg(v) \quad \text{for all } v \in V(G).$$

A degree-magic labeling $f$ of a graph $G$ is called \textit{balanced} if for all $v \in V(G)$, the following equation is satisfied

$$|\{e \in E(G) : \eta(v, e) = 1, f(e) \leq |E(G)/2|\}| = |\{e \in E(G) : \eta(v, e) = 1, f(e) > |E(G)/2|\}|.$$

A graph $G$ is \textit{degree-magic (balanced degree-magic)} or only \textit{d-magic} when a $d$-magic (balanced $d$-magic) labeling of $G$ exists.

A graph $G$ is called tripartite graph if $V(G)$ can be partitioned into three disjoint subsets $V_1, V_2$ and $V_3$, called partite sets, such that $uv$ is an edge of $G$ if $u$ and $v$ belong to different partite sets. If every two vertices in different partite sets are joined by an edge, then $G$ is a complete tripartite graph.

For any two vertex-disjoint graphs $G$ and $H$, the \textit{join} of graphs $G$ and $H$, denoted by $G + H$, consists of $G \cup H$ and all edges joining a vertex of $G$ and a vertex of $H$. The \textit{composition} of graphs $G$ and $H$, denoted by $G \cdot H$, is a graph such that the vertex set of $G \cdot H$ is the Cartesian product $V(G) \times V(H)$ and any two vertices $(u, v)$ and $(x, y)$ are adjacent in $G \cdot H$ if and only if either $u$ is adjacent to $x$ in $G$ or $u = x$ and $v$ is adjacent to $y$ in $H$.

The concept of magic graphs was put forward by Šedláček [8]. Later, supermagic graphs were introduced by Stewart [9]. Currently, numerous papers are published on magic and supermagic graphs (see [6][7][10] for more comprehensive references). The concept of degree-magic graphs was then introduced by Bezegová and Ivančo [2] as an extension of supermagic regular graphs. They established the basic properties of degree-magic graphs and characterized degree-magic and balanced degree-magic complete bipartite graphs in [2]. They also characterized degree-magic complete tripartite graphs in [4]. Some of these concepts are investigated in [1][3][5]. Hereinafter, the auxiliary results from these studies will be used.

\textbf{Theorem 1.1} ([2]). Let $G$ be a regular graph. Then $G$ is supermagic if and only if it is $d$-magic.

\textbf{Theorem 1.2} ([2]). Let $G$ be a $d$-magic graph of even size. Then every vertex of $G$ has an even degree and every component of $G$ has an even size.
Theorem 1.3 ([2]). Let $G$ be a balanced $d$-magic graph. Then $G$ has an even number of edges and every vertex has an even degree.

Theorem 1.4 ([2]). Let $G$ be a $d$-magic graph having a half-factor. Then $2G$ is a balanced $d$-magic graph.

Theorem 1.5 ([2]). Let $H_1$ and $H_2$ be edge-disjoint subgraphs of a graph $G$ which form its decomposition. If $H_1$ is $d$-magic and $H_2$ is balanced $d$-magic, then $G$ is a $d$-magic graph. Moreover, if $H_1$ and $H_2$ are both balanced $d$-magic, then $G$ is a balanced $d$-magic graph.

Proposition 1.1 ([2]). For $p, q > 1$, the complete bipartite graph $K_{p,q}$ is $d$-magic if and only if $p \equiv q \pmod{2}$ and $(p, q) \neq (2, 2)$.

Theorem 1.6 ([2]). The complete bipartite graph $K_{p,q}$ is balanced $d$-magic if and only if the following statements hold:

(i) $p \equiv q \equiv 0 \pmod{2}$;

(ii) if $p \equiv q \equiv 2 \pmod{4}$, then $\min(p, q) \geq 6$.

Lemma 1.1 ([4]). Let $p, q$ and $r$ be even positive integers. Then the complete tripartite graph $K_{p,q,r}$ is balanced $d$-magic.

Lemma 1.2 ([4]). Let $q \geq r$ be odd positive integers and let and $p$ be even positive integer such that $p \equiv 0 \pmod{4}$ whenever $q = 1$. Then the complete tripartite graph $K_{p,q,r}$ is $d$-magic.

2. Labelings in the Join of Complete Tripartite Graphs

For any positive integers $o, p, q, r, s$ and $t$, consider the join $K_{o,p,q} + K_{r,s,t}$ of complete tripartite graphs. Let $K_{o,p,q} + K_{r,s,t}$ be a $d$-magic graph. Since $\deg(v) = o + p + r + s + t$, $o + q + r + s + t$, $o + p + q + r + s + t$ or $o + p + q + r + t$ or $o + p + q + s + t$ is odd and $1 + op + oq + pq + rs + rt + st + (o + p + q)(r + s + t)$ is odd. Since $f$ satisfies $f^*(v) = (1 + op + oq + pq + rs + rt + st + (o + p + q)(r + s + t))\deg(v)/2$ and it is not an integer for some vertex $v \in V(K_{o,p,q} + K_{r,s,t})$, by [1.1], $f^*(v)$ is a sum of integers, a contradiction. 

Proposition 2.1. Let $K_{o,p,q} + K_{r,s,t}$ be a $d$-magic graph. Then the following statements hold:

(i) only three of $o, p, q, r, s$ and $t$ are even or

(ii) only four of $o, p, q, r, s$ and $t$ are even or

(iii) all of $o, p, q, r, s$ and $t$ are either odd or even.

Proof. Suppose that $f$ is a $d$-magic labeling of $K_{o,p,q} + K_{r,s,t}$. Assume to the contrary that only one of $o, p, q, r, s$ and $t$ is even, only two of $o, p, q, r, s$ and $t$ are even or only five of $o, p, q, r, s$ and $t$ are even. Thus, $o + p + r + s + t$, $o + q + r + s + t$, $p + q + r + s + t$, $o + p + q + r + s$, $a + p + q + r + t$ or $o + p + q + s + t$ is odd and $1 + op + oq + pq + rs + rt + st + (o + p + q)(r + s + t)$ is odd. Since $f$ satisfies $f^*(v) = (1 + op + oq + pq + rs + rt + st + (o + p + q)(r + s + t))\deg(v)/2$ and it is not an integer for some vertex $v \in V(K_{o,p,q} + K_{r,s,t})$, by [1.1], $f^*(v)$ is a sum of integers, a contradiction. 

Proposition 2.2. Let $K_{o,p,q} + K_{r,s,t}$ be a balanced $d$-magic graph. Then $o, p, q, r, s$ and $t$ are even.
Proof. Assume to the contrary that there exists one of \( o, p, q, r, s \) and \( t \) is odd. Thus, \( o + p + r + s + t \), \( o + q + r + s + t \), \( p + q + r + s + t \), \( o + p + q + r + t \) or \( o + p + q + s + t \) is odd. This means that some vertices of \( K_{o,p,q} + K_{r,s,t} \) have odd degrees. Since every vertex of balanced \( d \)-magic graph has an even degree, a contradiction.

The next result shows the sufficient condition for the existence of \( d \)-magic labelings of the join of complete tripartite graphs.

**Proposition 2.3.** Let \( o, p \) and \( q \) be even positive integers, let \( s \equiv t \) be odd positive integers and let and \( r \) be even positive integer such that \( r \equiv 0 \pmod{4} \) whenever \( s = 1 \). Then \( K_{o,p,q} + K_{r,s,t} \) is a \( d \)-magic graph.

Proof. Let \( o, p \) and \( q \) be even positive integers, let \( s \equiv t \) be odd positive integers and let and \( r \) be even positive integer such that \( r \equiv 0 \pmod{4} \) whenever \( s = 1 \). Then the graph \( K_{o,p,q} \) is balanced \( d \)-magic by Lemma 1.1 and the graph \( K_{r,s,t} \) is \( d \)-magic by Lemma 1.2. Since \( o + p + q \geq 6 \) and \( r + s + t \geq 6 \) are both even, the graph \( K_{o+p+q,r+s+t} \) is balanced \( d \)-magic by Theorem 1.6. Since \( K_{o,p,q} + K_{r,s,t} \) is the graph such that \( K_{o,p,q}, K_{r,s,t} \) and \( K_{o+p+q,r+s+t} \) form its decomposition, \( K_{o,p,q} + K_{r,s,t} \) is a \( d \)-magic graph by Theorem 1.5.

**Corollary 2.1.** Let \( o, p, q, r, s \) and \( t \) be even positive integers. If \( o = p = q = r = s = t \), then \( K_{o,p,q} + K_{r,s,t} \) is a supermagic graph.

Proof. Follows from Theorem 1.1 and Proposition 2.4.

**Example 2.1.** Consider the join of complete tripartite graphs \( K_{2,2,2} \) and \( K_{4,1,1} \). A \( d \)-magic graph \( K_{2,2,2} + K_{4,1,1} \) with the labels on edges is constructed as the following steps.

**Step I.** A balanced \( d \)-magic labeling \( f_1 \) from \( E(K_{2,2,2}) \) into \( \{1, 2, \ldots, 12\} \) (see Figure 1 and Table 1) and a \( d \)-magic labeling \( f_2 \) from \( E(K_{4,1,1}) \) into \( \{1, 2, \ldots, 9\} \) (see Figure 2 and Table 2) are defined as below.

![Figure 1](image-url)
Table 1. The labels on edges of balanced $d$-magic graph $K_{2,2,2}$

<table>
<thead>
<tr>
<th>Vertex</th>
<th>$d_1$</th>
<th>$d_2$</th>
<th>$e_1$</th>
<th>$e_2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$f_1$</td>
<td>12</td>
<td>1</td>
<td>5</td>
<td>8</td>
</tr>
<tr>
<td>$f_2$</td>

<td>3</td>
<td>11</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>$e_2$</td>
<td>2</td>
<td>10</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Figure 2. A $d$-magic graph $K_{4,1,1}$

Step II. Let $A_1 = \{ e \in E(K_{2,2,2}) : f_1(e) \leq 6 \}$ and $B_1 = \{ e \in E(K_{2,2,2}) : f_1(e) > 6 \}$ be given. Then a $d$-magic labeling $g_1$ from $E(K_{2,2,2} \cup K_{4,1,1})$ into $\{1, 2, \ldots, 21\}$ is defined by

$$g_1(e) = \begin{cases} 
  f_1(e) : e \in A_1, \\
  f_2(e) + 6 : e \in E(K_{4,1,1}), \\
  f_1(e) + 9 : e \in B_1.
\end{cases}$$

Thus, the $d$-magic graph $K_{2,2,2} \cup K_{4,1,1}$ and its labels on edges are shown in Figure 3 and Table 3, respectively.

Step III. A balanced $d$-magic labeling $f_3$ from $E(K_{6,6})$ into $\{1, 2, \ldots, 36\}$ (see Figure 4 and Table 4) is defined as follows.

Table 2. The labels on edges of $d$-magic graph $K_{4,1,1}$

<table>

<td>1</td>
<td>8</td>
<td>4</td>
<td>7</td>
<td>-</td>
</tr>
</tbody>
</table>

Figure 3. A $d$-magic graph $K_{2,2,2} \cup K_{4,1,1}$

Table 3. The labels on edges of $d$-magic graph $K_{2,2,2} \cup K_{4,1,1}$

<table>
<thead>
<tr>
<th>Vertex</th>
<th>$a_1$</th>
<th>$a_2$</th>
<th>$a_3$</th>
<th>$a_4$</th>
<th>$c_1$</th>
<th>Vertex</th>
<th>$d_1$</th>
<th>$d_2$</th>
<th>$e_1$</th>
<th>$e_2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$b_1$</td>
<td>15</td>
<td>8</td>
<td>12</td>
<td>9</td>
<td>11</td>
<td>$f_1$</td>
<td>21</td>
<td>1</td>
<td>5</td>
<td>17</td>
</tr>
<tr>
<td>$c_1$</td>
<td>7</td>
<td>14</td>
<td>10</td>
<td>13</td>
<td>-</td>
<td>$f_2$</td>
<td>18</td>
<td>4</td>
<td>16</td>
<td>6</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>$e_1$</td>
<td>3</td>
<td>20</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>$e_2$</td>
<td>2</td>
<td>19</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
Step IV. The graph \( K_{2,2,2} + K_{4,1,1} \) is a graph such that \( K_{2,2,2} \cup K_{4,1,1} \) and \( K_{6,6} \) form its decomposition. Let \( A_2 = \{ e \in E(K_{6,6}) : f_3(e) \leq 18 \} \) and \( B_2 = \{ e \in E(K_{6,6}) : f_3(e) > 18 \} \) be given. Then a \( d \)-magic labeling \( g_2 \) from \( E(K_{2,2,2} + K_{4,1,1}) \) into \( \{1,2,\ldots,57\} \) is defined by

\[
g_2(e) = \begin{cases} 
  f_3(e) : e \in A_2, \\
  g_1(e) + 18 : e \in E(K_{2,2,2} \cup K_{4,1,1}), \\
  f_3(e) + 21 : e \in B_2. 
\end{cases}
\]

Therefore, the \( d \)-magic graph \( K_{2,2,2} + K_{4,1,1} \) and its labels on edges are shown in Figure 5 and Table 5, respectively.

**Figure 4.** A balanced \( d \)-magic graph \( K_{6,6} \)

3. Labelings in the Composition of Complete Tripartite Graphs

For any positive integers $o,p,q,r,s$ and $t$, consider the composition $K_{o,p,q}\cdot K_{r,s,t}$ of complete tripartite graphs. Let $K_{o,p,q}\cdot K_{r,s,t}$ be a $d$-magic graph. Since $\deg(v)$ is $(o+p)(r+s+t)+r+s,$ $(o+p)(r+s+t)+r+t,$ $(o+q)(r+s+t)+r+s,$ $(o+q)(r+s+t)+r+t,$ $(o+q)(r+s+t)+s+t,$ $(p+q)(r+s+t)+r+s,$ $(p+q)(r+s+t)+r+t$ or $(p+q)(r+s+t)+s+t$ and $f^*(v) = (1+(r+s+t)^2(oq+op+pq)+(rs+rt+st)(o+p+q))\deg(v)/2$ for any vertex $v \in V(K_{o,p,q}\cdot K_{r,s,t}),$ giving the following results.

Proposition 3.1. Let $K_{o,p,q}\cdot K_{r,s,t}$ be a $d$-magic graph. Then the following statements hold:

(i) only one of $o,p,q,r,s$ and $t$ is even or

(ii) only three of $o,p,q,r,s$ and $t$ are even or

(iii) all of $o,p,q,r,s$ and $t$ are either odd or even or

(iv) only one of $o,p$ and $q$ is even and all of $r,s$ and $t$ are even or

(v) only two of $o,p$ and $q$ are even and all of $r,s$ and $t$ are even or

(vi) all of $o,p$ and $q$ are odd and only two of $r,s$ and $t$ are even or

(vii) only two of $o,p$ and $q$ are even and all of $r,s$ and $t$ are odd.

Proof. Suppose that $f$ is a $d$-magic labeling of $K_{o,p,q}\cdot K_{r,s,t}$. Assume to the contrary that only one of $o,p$ and $q$ is even and only one of $r,s$ and $t$ is even, only two of $o,p$ and $q$ are even and only two of $r,s$ and $t$ are even, all of $o,p$ and $q$ are even and only one of $r,s$ and $t$ is even or all of $o,p$ and $q$ are even and only two of $r,s$ and $t$ are even. Thus, $(o+p)(r+s+t)+r+s,$ $(o+p)(r+s+t)+r+t,$ $(o+p)(r+s+t)+s+t,$ $(o+q)(r+s+t)+r+s,$ $(o+q)(r+s+t)+r+t,$ $(o+q)(r+s+t)+s+t,$ $(p+q)(r+s+t)+r+s,$ $(p+q)(r+s+t)+r+t$ or $(p+q)(r+s+t)+s+t$ is odd and $1+(r+s+t)^2(oq+op+pq)+(rs+rt+st)(o+p+q)$ is odd. Since $f$ satisfies $f^*(v) = (1+(r+s+t)^2(oq+op+pq)+(rs+rt+st)(o+p+q))\deg(v)/2$ and it is not an integer for some vertex $v \in V(K_{o,p,q}\cdot K_{r,s,t})$ by (1.1), $f^*(v)$ is a sum of integers, a contradiction.

Proposition 3.2. Let $K_{o,p,q}\cdot K_{r,s,t}$ be a balanced $d$-magic graph. Then the following statements hold:

(i) all of $r,s$ and $t$ are even or

(ii) all of $o,p,q,r,s$ and $t$ are odd or

(iii) all of $o,p$ and $q$ are even and all of $r,s$ and $t$ are odd.

Proof. Assume to the contrary that only one of $o,p,q,r,s$ and $t$ is even, only two of $o,p,q,r,s$ and $t$ are even, only three of $o,p,q,r,s$ and $t$ are even but all of $o,p$ and $q$ are neither odd nor even, only four of $o,p,q,r,s$ and $t$ are even but all of $r,s$ and $t$ are not even or only five of $o,p,q,r,s$ and $t$ are even but all of $r,s$ and $t$ are not even. Thus, $(o+p)(r+s+t)+r+s,$ $(o+p)(r+s+t)+r+t,$ $(o+p)(r+s+t)+s+t,$ $(o+q)(r+s+t)+r+s,$ $(o+q)(r+s+t)+r+t,$ $(o+q)(r+s+t)+s+t,$ $(p+q)(r+s+t)+r+s,$ $(p+q)(r+s+t)+r+t$ or $(p+q)(r+s+t)+s+t$ is odd. This means that some vertices of $K_{o,p,q}\cdot K_{r,s,t}$ have odd degrees. Since every vertex of balanced $d$-magic graph has an even degree, a contradiction.
In the next result, the sufficient condition for the existence of \(d\)-magic labelings of the composition of complete tripartite graphs is found.

**Proposition 3.3.** Let \(o, p\) and \(q\) be positive integers and let \(r, s\) and \(t\) be even positive integers. Then \(K_{o,p,q} \cdot K_{r,s,t}\) is a balanced \(d\)-magic graph.

**Proof.** Let \(o, p\) and \(q\) be positive integers and let \(r, s\) and \(t\) be even positive integers. Then the graph \(K_{r,s,t}\) is balanced \(d\)-magic by Lemma 1.1. Since \(r + s + t \geq 6\) are even, the graph \(K_{r+s+t,r+s+t}\) is balanced \(d\)-magic by Theorem 1.6. The graph \(K_{o,p,q} \cdot K_{r,s,t}\) is decomposed into \(op + oq + pq\) balanced \(d\)-magic subgraphs isomorphic to \(K_{r+s+t,r+s+t}\) and \(o + p + q\) balanced \(d\)-magic subgraphs isomorphic to \(K_{r,s,t}\). According Theorem 1.5, \(K_{o,p,q} \cdot K_{r,s,t}\) is a balanced \(d\)-magic graph.

**Corollary 3.1.** Let \(o, p\) and \(q\) be positive integers and let \(r, s\) and \(t\) be even positive integers. If \(o = p = q\) and \(r = s = t\), then \(K_{o,p,q} \cdot K_{r,s,t}\) is a supermagic graph.

**Proof.** Follows from Theorem 1.1 and Proposition 3.3.

**Example 3.1.** Consider the composition of complete tripartite graphs \(K_{1,1,1}\) and \(K_{2,2,2}\). A balanced \(d\)-magic graph \(K_{1,1,1} \cdot K_{2,2,2}\) with the labels on edges is constructed as the following steps.

**Step I.** A balanced \(d\)-magic graph \(K_{2,2,2}\) is defined in Figure 1 and Table 1. Let \(A_3 = \{e \in E(K_{2,2,2}): f_1(e) \leq 6\}\) and \(B_3 = \{e \in E(K_{2,2,2}): f_1(e) > 6\}\) be given. For \(i \in \{1, 2\}\), let \(K_{2,2,2}^i\) be a copy of \(K_{2,2,2}\) and let \(e_i\) be its edge corresponding to \(e \in E(K_{2,2,2})\). Suppose that \(2K_{2,2,2} = K_{2,2,2}^1 \cup K_{2,2,2}^2\). Then a balanced \(d\)-magic labeling \(g_3\) from \(E(2K_{2,2,2})\) into \(\{1, 2, \ldots, 24\}\) is defined by

\[
g_3(e_i) = \begin{cases} 
  f_1(e) : i = 1 \text{ and } e \in A_3, \\
  f_1(e) + 12 : i = 1 \text{ and } e \in B_3, \\
  f_1(e) + 12 : i = 2 \text{ and } e \in A_3, \\
  f_1(e) : i = 2 \text{ and } e \in B_3.
\end{cases}
\]

Thus, the balanced \(d\)-magic graph \(2K_{2,2,2}\) and its labels on edges are shown in Figure 6 and Table 6 respectively.

**Figure 6.** A balanced \(d\)-magic graph \(2K_{2,2,2}\)

**Table 6.** The labels on edges of balanced \(d\)-magic graph \(2K_{2,2,2}\)

Step II. The graph $3K_{2,2,2}$ is a graph such that $2K_{2,2,2}$ and $K_{2,2,2}$ form its decomposition. Let $A_4 = \{e \in E(2K_{2,2,2}) : g_3(e) \leq 12\}$ and $B_4 = \{e \in E(2K_{2,2,2}) : g_3(e) > 12\}$ be given. Then a balanced $d$-magic labeling $g_4$ from $E(3K_{2,2,2})$ into $\{1, 2, \ldots, 36\}$ is defined by
\[
g_4(e) = \begin{cases} 
g_3(e) : e \in A_4, \\
g_3(e) + 12 : e \in E(K_{2,2,2}), \\
g_3(e) + 12 : e \in B_4.
\end{cases}
\]
Thus, the balanced $d$-magic graph $3K_{2,2,2}$ and its labels on edges are shown in Figure 7 and Table 7, respectively.

<td>14</td>
<td>22</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Step III. A balanced $d$-magic graph $K_{6,6}$ is defined in Figure and Table 4. Let $K^1_{6,6} = K^2_{6,6} = K_{6,6}$ be given. The graph $K_{6,12}$ is a graph such that $K^1_{6,6}$ and $K^2_{6,6}$ form its decomposition. Let $A_5 = \{e \in E(K^1_{6,6}) : f_3(e) \leq 18\}$ and $B_5 = \{e \in E(K^1_{6,6}) : f_3(e) > 18\}$ be given. Then a balanced $d$-magic labeling $g_5$ from $E(K_{6,12})$ into $\{1, 2, \ldots, 72\}$ is defined by
\[
g_5(e) = \begin{cases} 
f_3(e) : e \in A_5, \\
f_3(e) + 18 : e \in E(K^2_{6,6}), \\
f_3(e) + 36 : e \in B_5.
\end{cases}
\]
Thus, the balanced $d$-magic graph $K_{6,12}$ and its labels on edges are shown in Figure and Table 8, respectively.

Step IV. The graph $K_{6,6,6}$ is a graph such that $K_{6,6}$ and $K_{6,12}$ form its decomposition. Let $A_6 = \{e \in E(K_{6,12}) : g_5(e) \leq 36\}$ and $B_6 = \{e \in E(K_{6,12}) : g_5(e) > 36\}$ be given. Then a balanced $d$-magic labeling $g_6$ from $E(K_{6,6,6})$ into $\{1, 2, \ldots, 108\}$ is defined by
\[
g_6(e) = \begin{cases} 
g_5(e) : e \in A_6, \\
g_5(e) + 36 : e \in E(K_{6,6}), \\
g_5(e) + 36 : e \in B_6.
\end{cases}
\]
Thus, the balanced $d$-magic graph $K_{6,6,6}$ and its labels on edges are shown in Figure 9 and Table 9 respectively.

<td>66</td>
<td>1</td>
<td>49</td>
<td>30</td>
<td>36</td>
<td>37</td>
<td>48</td>
<td>19</td>
</tr>
</tbody>
</table>

**Step V.** The graph $K_{1,1,1} \cdot K_{2,2,2}$ is a graph such that $3K_{2,2,2}$ and $K_{6,6,6}$ form its decomposition. Let $A_7 = \{e \in E(K_{6,6,6}) : g_6(e) \leq 54\}$ and $B_7 = \{e \in E(K_{6,6,6}) : g_6(e) > 54\}$ be given. Then a balanced $d$-magic labeling $g_7$ from $E(K_{1,1,1} \cdot K_{2,2,2})$ into $(1,2,\ldots,144)$ is defined by

$$g_7(e) = \begin{cases} 
    cg_6(e) : & e \in A_7, \\
    g_4(e) + 54 : & e \in E(3K_{2,2,2}), \\
    g_6(e) + 36 : & e \in B_7. 
\end{cases}$$

Therefore, the balanced $d$-magic graph $K_{1,1,1} \cdot K_{2,2,2}$ and its labels on edges are shown in Figure 10, Table 10 and Table 11 respectively.

Figure 10. A balanced $d$-magic graph $K_{1,1,1} \cdot K_{2,2,2}$
4. Conclusion

In this paper, the necessary and sufficient conditions for the existence of degree-magic labelings on tripartite graphs under some binary operations have been examined and proven. However, the labeling of discrete structures is an extensive field of study, so a further open area of research would be to investigate and derive similar results for different families in the context of varying graph-labeling problems.
