**Abstract.** In this paper, we introduce and investigate the notion of contra $\pi g\gamma$-continuous functions by utilizing $\pi g\gamma$-closed sets [31]. We obtain fundamental properties of contra $\pi g\gamma$-continuous functions and discuss the relationships between contra $\pi g\gamma$-continuity and other related functions.

**Keywords.** $\pi g\gamma$-closed set; $\pi g\gamma$-continuous function; Contra $\pi g\gamma$-continuous function; Contra $\pi g\gamma$-graph; $\pi g\gamma$-normal space

1. Introduction

In 1996, Dontchev [9] introduced a new class of functions called contra-continuous functions. He defined a function $f : X \rightarrow Y$ to be contra-continuous if the pre image of every open set of $Y$ is closed in $X$. In 2007, Caldas et al. [7] introduced and investigated the notion of contra $g$-continuity. In 1968, Zaitsev [35] introduced the notion of $\pi$-open sets as a finite union of regular open sets. This notion received a proper attention and some research articles came to existence. Dontchev and Noiri [10] introduced and investigated $\pi$-continuity and $\pi g$-continuity. Ekici and Baker [13] studied further properties of $\pi g$-closed sets and continuities. In 2007, Ekici [14] introduced and studied some new forms of continuities. In [20], Kalantan introduced and investigated $\pi$-normality. The digital $n$-space is not a metric space, since it is not $T_1$. But recently Takigawa and Maki [34] showed that in the digital $n$-space every closed set is $\pi$-open. Recently, Ekici [15] introduced and studied contra $\pi g$-continuous functions. In 2010, Caldas et al. [8] introduced and studied contra $\pi gp$-continuity.
In this paper, we present a new generalization of contra-continuity called contra \( \pi g \gamma \)-continuity. It turns out that the notion of contra \( \pi g \gamma \)-continuity is a weaker form of contra \( \pi g \)-continuity and contra \( \pi g p \)-continuity.

### 2. Preliminaries

Throughout this paper, spaces \((X, \tau)\) and \((Y, \sigma)\) (or simply \(X\) and \(Y\)) always mean topological spaces on which no separation axioms are assumed unless explicitly stated. Let \(A\) be a subset of a space \(X\). The closure of \(A\) and the interior of \(A\) are denoted by \(\text{cl}(A)\) and \(\text{int}(A)\), respectively. A subset \(A\) of \(X\) is said to be regular open \([33]\) (resp. regular closed \([33]\)) if \(A = \text{int}(\text{cl}(A))\) (resp. \(A = \text{cl}(\text{int}(A))\)). The finite union of regular open sets is said to be \(\pi\)-open \([35]\). The complement of a \(\pi\)-open set is said to be \(\pi\)-closed \([35]\).

**Definition 2.1.** A subset \(A\) of a space \(X\) is said to be

1. pre-closed \([23]\) if \(\text{cl}(\text{int}(A)) \subseteq A\);
2. semi-open \([21]\) if \(A \subseteq \text{cl}(\text{int}(A))\);
3. \(\beta\)-open \([11]\) if \(A \subseteq \text{cl}(\text{cl}(\text{int}(A)))\);
4. \(b\)-open \([4]\) or \(sp\)-open \([11]\) or \(\gamma\)-open \([16]\) if \(A \subseteq \text{cl}(\text{int}(A)) \cup \text{int}(\text{cl}(A))\);
5. \(\gamma\)-closed \([16]\) if \(\text{int}(\text{cl}(A)) \cap \text{cl}(\text{int}(A)) \subseteq A\);
6. \(g\)-closed \([22]\) if \(\text{cl}(A) \subseteq U\) whenever \(A \subseteq U\) and \(U\) is open in \(X\);
7. \(gp\)-closed \([27]\) if \(\text{pcl}(A) \subseteq U\) whenever \(A \subseteq U\) and \(U\) is open in \(X\);
8. \(g\gamma\)-closed \([12]\) if \(\gamma \text{cl}(A) \subseteq U\), whenever \(A \subseteq U\) and \(U\) is open in \(X\);
9. \(\pi g\)-closed \([10]\) if \(\text{cl}(A) \subseteq U\) whenever \(A \subseteq U\) and \(U\) is \(\pi\)-open in \(X\);
10. \(\pi gp\)-closed \([28]\) if \(\text{pcl}(A) \subseteq U\) whenever \(A \subseteq U\) and \(U\) is \(\pi\)-open in \(X\);
11. \(\pi g\gamma\)-closed \([31]\) if \(\gamma \text{cl}(A) \subseteq U\) whenever \(A \subseteq U\) and \(U\) is \(\pi\)-open in \(X\).

The complements of the above closed sets are called their respective open sets.

The complements of the above open sets are called their respective closed sets.

The intersection of all pre-closed (resp. \(\gamma\)-closed) sets containing \(A\) is called pre-closure (resp. \(\gamma\)-closure) of \(A\) and is denoted by \(\text{pcl}(A)\) (resp. \(\gamma \text{cl}(A)\)).

The family of all \(\pi g\gamma\)-open (resp. \(\pi g\gamma\)-closed, closed) sets of \(X\) containing a point \(x \in X\) is denoted by \(\pi G\gamma O(X, x)\) (resp. \(\pi G\gamma C(X, x)\), \(C(X, x)\)). The family of all \(\pi g\gamma\)-open (resp. \(\pi g\gamma\)-closed, closed, semi-open, \(\gamma\)-open) sets of \(X\) is denoted by \(\pi G\gamma O(X)\) (resp. \(\pi G\gamma C(X)\), \(C(X)\), \(SO(X)\), \(\gamma O(X)\)).

**Definition 2.2.** Let \(A\) be a subset of a space \((X, \tau)\).

1. The set \(\bigcap\{U \in \tau : A \subseteq U\}\) is called the kernel of \(A\) \([24]\) and is denoted by \(\ker(A)\).
2. The set \(\bigcap\{F : F \text{ is } \pi g\gamma\text{-closed in } X : A \subseteq F\}\) is called the \(\pi g\gamma\)-closure of \(A\) \([8]\) and is denoted by \(\pi g\gamma \text{-cl}(A)\).
3. The set \(\bigcup\{F : F \text{ is } \pi g\gamma\text{-open in } X : A \supseteq F\}\) is called the \(\pi g\gamma\)-interior of \(A\) \([8]\) and is denoted by \(\pi g\gamma \text{-int}(A)\).
Lemma 2.3 ([19]). The following properties hold for subsets $U$ and $V$ of a space $(X,\tau)$.

1. $x \in \ker(U)$ if and only if $U \cap F \neq \emptyset$ for any closed set $F \in C(X,\tau)$;
2. $U \subseteq \ker(U)$ and $U = \ker(U)$ if $U$ is open in $X$;
3. If $U \subseteq V$, then $\ker(U) \subseteq \ker(V)$.

Lemma 2.4 ([3]). Let $A$ be a subset of a space $(X,\tau)$, then

1. $\pi g\gamma$-$\text{cl}(X - A) = X - \pi g\gamma$-$\text{int}(A)$;
2. $x \in \pi g\gamma$-$\text{cl}(A)$ if and only if $A \cap U \neq \emptyset$ for each $U \in \pi G\gamma O(X,\tau)$;
3. If $A$ is $\pi g\gamma$-closed in $X$, then $A = \pi g\gamma$-$\text{cl}(A)$.

Remark 2.5 ([3]). If $A = \pi g\gamma$-$\text{cl}(A)$, then $A$ need not be a $\pi g\gamma$-closed.

Example 2.6 ([3]). Let $X = \{a, b, c, d, e, f\}$ and $\tau = \{\emptyset, X, \{a\}, \{c, d\}, \{a, b, c, d\}\}$. Take $A = \{a, b, c, d\}$. Clearly $\pi g\gamma$-$\text{cl}(A) = A$ but $A$ is not $\pi g\gamma$-closed.

Lemma 2.7. [4] Let $A$ be a subset of a space $X$. Then $\gamma \text{cl}(A) = A \cup [\text{int}(\text{cl}(A)) \cap \text{cl}(\text{int}(A))]$.

Remark 2.8 ([31]).

1. The union of two $\pi g\gamma$-closed sets need not be $\pi g\gamma$-closed.
2. The intersection of two $\pi g\gamma$-closed sets need not be $\pi g\gamma$-closed.

Example 2.9 ([31]). Let $X = \{a, b, c, d\}$ and $\tau = \{\emptyset, X, \{a\}, \{d\}, \{a, d\}\}$. Take $A = \{a\}$ and $B = \{d\}$. Then $A \cup B = \{a\} \cup \{d\} = \{a, d\}$ is not $\pi g\gamma$-closed. Also take $C = \{a, b, d\}$ and $D = \{a, c, d\}$. Then $C \cap D = \{a, b, d\} \cap \{a, c, d\} = \{a, d\}$ is not $\pi g\gamma$-closed.

3. Contra $\pi g\gamma$-Continuous Functions

Definition 3.1. A function $f : X \to Y$ is called contra $\pi g\gamma$-continuous if $f^{-1}(V)$ is $\pi g\gamma$-closed in $X$ for every open set $V$ of $Y$.

Theorem 3.2. Suppose $\pi G\gamma O(X)$ is closed under arbitrary union. The following are equivalent for a function $f : X \to Y$:

1. $f$ is contra $\pi g\gamma$-continuous;
2. The inverse image of every closed set of $Y$ is $\pi g\gamma$-open in $X$;
3. For each $x \in X$ and each closed set $V$ in $Y$ with $f(x) \in V$, there exists a $\pi g\gamma$-open set $U$ in $X$ such that $x \in U$ and $f(U) \subseteq V$;
4. $f(\pi g\gamma$-$\text{cl}(A)) \subseteq \ker(f(A))$ for every subset $A$ of $X$;
5. $\pi g\gamma$-$\text{cl}(f^{-1}(B)) \subseteq f^{-1}(\ker(B))$ for every subset $B$ of $Y$.

Proof. (1)$\Rightarrow$(2): Let $U$ be any closed set of $Y$. Since $Y/U$ is open, then by (1), it follows that $f^{-1}(Y/U) = X/f^{-1}(U)$ is $\pi g\gamma$-closed. This shows that $f^{-1}(U)$ is $\pi g\gamma$-open in $X$. 

Let $x \in X$ and $V$ be a closed set in $Y$ with $f(x) \in V$. By (1), it follows that $f^{-1}(Y/V) = X/f^{-1}(V)$ is $\pi g\gamma$-closed and so $f^{-1}(V)$ is $\pi g\gamma$-open. Take $U = f^{-1}(V)$, we obtain that $x \in U$ and $f(U) \subseteq V$.

(3)\Rightarrow(2): Let $V$ be a closed set in $Y$ with $x \in f^{-1}(V)$. Since $f(x) \in V$, by (3) there exists a $\pi g\gamma$-open set $U$ in $X$ containing $x$ such that $f(U) \subseteq V$. It follows that $x \in U \subseteq f^{-1}(V)$. Hence $f^{-1}(V)$ is $\pi g\gamma$-open.

(2)\Rightarrow(4): Let $A$ be any subset of $X$. Let $y \notin \ker(f(A))$. Then by Lemma 2.3, there exist a closed set $F$ containing $y$ such that $f(A) \cap F = \emptyset$. We have $A \cap f^{-1}(F) = \emptyset$ and since $f^{-1}(F)$ is $\pi g\gamma$-open then we have $\pi g\gamma\text{-cl}(A) \cap f^{-1}(F) = \emptyset$. Hence we obtain $f(\pi g\gamma\text{-cl}(A)) \cap f^{-1}(F) = \emptyset$ and $y \notin f(\pi g\gamma\text{-cl}(A))$. Thus $f(\pi g\gamma\text{-cl}(A)) \subseteq \ker(f(A))$.

(4)\Rightarrow(5): Let $B$ be any subset of $Y$. By (4), $f(\pi g\gamma\text{-cl}(f^{-1}(B))) \subseteq \ker(B)$ and $\pi g\gamma\text{-cl}(f^{-1}(B)) \subseteq f^{-1}(\ker(B))$.

(5)\Rightarrow(1): Let $B$ be any open set of $Y$. By (5), $\pi g\gamma\text{-cl}(f^{-1}(B)) \subseteq f^{-1}(\ker(B)) = f^{-1}(B)$ and $\pi g\gamma\text{-cl}(f^{-1}(B)) = f^{-1}(B)$. So we obtain that $f^{-1}(B)$ is $\pi g\gamma$-closed in $X$.

**Definition 3.3.** A function $f : X \to Y$ is said to be

1. completely continuous [5] if $f^{-1}(V)$ is regular open in $X$ for every open set $V$ of $Y$;
2. contra-continuous [9] (resp. contra pre-continuous [18], contra $\gamma$-continuous [25]) if $f^{-1}(V)$ is closed (resp. pre-closed, $\gamma$-closed) in $X$ for every open set $V$ of $Y$;
3. contra $g$-continuous [7] (resp. contra $gp$-continuous [8], contra $g\gamma$-continuous [21]) if $f^{-1}(V)$ is $g$-closed (resp. $gp$-closed, $g\gamma$-closed) in $X$ for every open set $V$ of $Y$;
4. contra $\pi$-continuous [8] (resp. contra $\pi g$-continuous [15], contra $\pi gp$-continuous [8]) if $f^{-1}(V)$ is $\pi$-closed (resp. $\pi g$-closed, $\pi gp$-closed) in $X$ for every open set $V$ of $Y$.

For the functions defined above, we have the following implications:

<table>
<thead>
<tr>
<th>contra $\pi$-continuity</th>
<th>contra-continuity</th>
<th>contra pre-continuity</th>
</tr>
</thead>
<tbody>
<tr>
<td>contra $g$-continuity</td>
<td>contra $gp$-continuity</td>
<td></td>
</tr>
<tr>
<td>contra $\pi g$-continuity</td>
<td>contra $\pi gp$-continuity</td>
<td></td>
</tr>
</tbody>
</table>

**Remark 3.4.** None of these implications is reversible as shown by the following Examples and the related paper [8].

**Example 3.5.** Let $X = \{a, b, c, d, e\}$, $\tau = \{\emptyset, X, \{a\}, \{e\}, \{a, e\}, \{c, d\}, \{a, c, d\}, \{c, d, e\}, \{a, c, d, e\}, \{b, c, d, e\}\}$ and $\sigma = \{\emptyset, X, \{c, d\}\}$. Then the identity function $f : (X, \tau) \to (X, \sigma)$ is contra $\pi g\gamma$-continuous but not contra $\pi g$-continuous.
Theorem 3.11. For a function $f : X \rightarrow Y$ is said to be

(1) $\pi g\gamma$-semiopen if $f(U) \subseteq SO(Y)$ for every $\pi g\gamma$-open set $U$ of $X$;
(2) contra-$I(\pi g\gamma)$-continuous if for each $x \in X$ and each $F \subseteq C(Y, f(x)$), there exists $U \in \pi G\gamma O(X, x)$ such that $int(f(U)) \subseteq F$.
(3) $\pi$-continuous [10] if $f^{-1}(F)$ is $\pi$-closed in $X$ for every closed set $F$ of $Y$;
(4) $\pi g\gamma$-continuous [31] if $f^{-1}(F)$ is $\pi g\gamma$-closed in $X$ for every closed set $F$ of $Y$.

Theorem 3.8. If a function $f : X \rightarrow Y$ is contra-$I(\pi g\gamma)$-continuous and $\pi g\gamma$-semiopen, then $f$ is contra $\pi g\gamma$-continuous.

Proof. Suppose that $x \in X$ and $F \in C(Y, f(x))$. Since $f$ is contra-$I(\pi g\gamma)$-continuous, there exists $U \in \pi G\gamma O(X, x)$ such that $int(f(U)) \subseteq F$. By hypothesis $f$ is $\pi g\gamma$-semiopen, therefore $f(U) \subseteq SO(Y)$ and $f(U) \subseteq \text{cl}(int(f(U))) \subseteq F$. This shows that $f$ is contra $\pi g\gamma$-continuous.

Lemma 3.9 ([8]). For a subset $A$ of $(X, \tau)$, the following statements are equivalent.

(1) $A$ is $\pi$-open and $\pi g\gamma$-closed;
(2) $A$ is regular open.

Lemma 3.10 ([8]). A function $f : X \rightarrow Y$ is $\pi$-continuous if and only if $f^{-1}(V)$ is $\pi$-open in $X$ for every open set $V$ of $Y$.

Theorem 3.11. For a function $f : X \rightarrow Y$, the following statements are equivalent.

(1) $f$ is contra $\pi g\gamma$-continuous and $\pi$-continuous;
(2) $f$ is completely continuous.

Proof. (1)$\Rightarrow$(2): Let $U$ be an open set in $Y$. Since $f$ is contra $\pi g\gamma$-continuous and $\pi$-continuous, $f^{-1}(U)$ is $\pi g\gamma$-closed and $\pi$-open, by Lemma 3.9, $f^{-1}(U)$ is regular open. Then $f$ is completely continuous.

(2)$\Rightarrow$(1): Let $U$ be an open set in $Y$. Since $f$ is completely continuous, $f^{-1}(U)$ is regular open, by Lemma 3.9, $f^{-1}(U)$ is $\pi g\gamma$-closed and $\pi$-open. Then $f$ is contra $\pi g\gamma$-continuous and $\pi$-continuous.

Theorem 3.12. If a function $f : X \rightarrow Y$ is contra $\pi g\gamma$-continuous and $Y$ is regular, then $f$ is $\pi g\gamma$-continuous.

Proof. Let $x$ be an arbitrary point of $X$ and $U$ be an open set of $Y$ containing $f(x)$. Since $Y$ is regular, there exists an open set $W$ in $Y$ containing $f(x)$ such that $\text{cl}(W) \subseteq U$. Since $f$ is contra $\pi g\gamma$-continuous, there exists $V \in \pi G\gamma O(X, x)$ such that $f(V) \subseteq \text{cl}(W)$. Then $f(V) \subseteq \text{cl}(W) \subseteq U$. Hence $f$ is $\pi g\gamma$-continuous.
Theorem 3.13. Let \( \{X_i : i \in \Omega\} \) be any family of topological spaces. If a function \( f : X \to \prod X_i \) is contra \( \pi g\gamma \)-continuous, then \( \Pr_i \circ f : X \to X_i \) is contra \( \pi g\gamma \)-continuous for each \( i \in \Omega \), where \( \Pr_i \) is the projection of \( \prod X_i \) onto \( X_i \).

**Proof.** For a fixed \( i \in \Omega \), let \( V_i \) be any open set of \( X_i \). Since \( \Pr_i \) is continuous, \( \Pr_i^{-1}(V_i) \) is open in \( \prod X_i \). Since \( f \) is contra \( \pi g\gamma \)-continuous, \( f^{-1}(\Pr_i^{-1}(V_i)) = (\Pr_i \circ f)^{-1}(V_i) \) is \( \pi g\gamma \)-closed in \( X \). Therefore, \( \Pr_i \circ f \) is contra \( \pi g\gamma \)-continuous for each \( i \in \Omega \). \( \square \)

Theorem 3.14. Let \( f : X \to Y \) and \( g : Y \to Z \) be a function. Then the following hold:

1. If \( f \) is contra \( \pi g\gamma \)-continuous and \( g \) is continuous, then \( g \circ f : X \to Z \) is contra \( \pi g\gamma \)-continuous;
2. If \( f \) is \( \pi g\gamma \)-continuous and \( g \) is contra-continuous, then \( g \circ f : X \to Z \) is contra \( \pi g\gamma \)-continuous;
3. If \( f \) is contra \( \pi g\gamma \)-continuous and \( g \) is contra-continuous, then \( g \circ f : X \to Z \) is \( \pi g\gamma \)-continuous.

Definition 3.15. A space \((X, \tau)\) is called \( \pi g\gamma-T_{1/2} \) if every \( \pi g\gamma \)-closed set is \( \gamma \)-closed.

Remark 3.16. Every contra \( \pi g\gamma \)-continuous function defined on a \( \pi g\gamma-T_{1/2} \) space is contra \( \gamma \)-continuous.

Remark 3.17. For the functions defined above, we have the following implications:

\[
\text{contra } \gamma\text{-continuous} \to \text{contra } g\gamma\text{-continuous} \to \text{contra } \pi g\gamma\text{-continuous}
\]

None of these implications is reversible as shown by the following examples:

Example 3.18. Let \( X = \{a, b, c\}, \tau = \{\emptyset, X, \{a\}\} \) and \( \sigma = \{\emptyset, X, \{a, b\}\} \). Then the identity function \( f : (X, \tau) \to (X, \sigma) \) is \( g\gamma \)-continuous but not contra \( \gamma \)-continuous.

Example 3.19. Let \( X = \{a, b, c\}, \tau = \{\emptyset, X, \{a\}\} \) and \( \sigma = \{\emptyset, X, \{a\}, \{b\}, \{a, b\}\} \). Then the identity function \( f : (X, \tau) \to (X, \sigma) \) is contra \( \pi g\gamma \)-continuous but not contra \( g\gamma \)-continuous.

Theorem 3.20. Let \( f : X \to Y \) be a function. Suppose that \( X \) is a \( \pi g\gamma-T_{1/2} \) space. Then the following are equivalent.

1. \( f \) is contra \( \pi g\gamma \)-continuous;
2. \( f \) is contra \( g\gamma \)-continuous;
3. \( f \) is contra \( \gamma \)-continuous.

**Proof.** Obvious. \( \square \)

Definition 3.21. For a space \((X, \tau)\), \( \pi \tau^f = \{U \subseteq X : \pi g\gamma\text{-cl}(X \setminus U) = X \setminus U\} \).

Theorem 3.22. Let \((X, \tau)\) be a space. Then
Theorem 4.3. Let 

(1) Every \( \pi g \gamma \)-closed set is \( \gamma \)-closed (i.e. \((X, \tau)\) is \( \pi g \gamma \cdot T_{1/2} \)) if and only if \( \pi \tau^r = \gamma O(X) \);

(2) Every \( \pi g \gamma \)-closed set is closed if and only if \( \pi \tau^r = \tau \).

Proof. (1) Let \( A \in \pi \tau^r \). Then \( \pi g \gamma \cdot cl(X \backslash A) = X \backslash A \). By hypothesis, \( \gamma cl(X \backslash A) = \pi g \gamma \cdot cl(X \backslash A) = X \backslash A \) and hence \( A \in \gamma O(X) \).

Conversely, let \( A \) be a \( \pi g \gamma \)-closed set. Then \( \pi g \gamma \cdot cl(A) = A \) and hence \( X \backslash A \in \pi \tau^r = \gamma O(X) \), i.e. \( A \) is \( \gamma \)-closed.

(2) Similar to (1).

\[ \square \]

Theorem 3.23. If \( \pi \tau^r = \tau \) in \( X \), then for a function \( f : X \rightarrow Y \) the following are equivalent:

1. \( f \) is contra \( \pi g \gamma \)-continuous;
2. \( f \) is contra \( \pi g \)-continuous;
3. \( f \) is contra \( g \)-continuous;
4. \( f \) is contra-continuous.

Proof. Obvious.  \[ \square \]

4. Properties of Contra \( \pi g \gamma \)-Continuous Functions

Definition 4.1. A space \( X \) is said to be \( \pi g \gamma \cdot T_1 \) if for each pair of distinct points \( x \) and \( y \) in \( X \), there exist \( \pi g \gamma \)-open sets \( U \) and \( V \) containing \( x \) and \( y \) respectively, such that \( y \notin U \) and \( x \notin V \).

Definition 4.2 (29). A space \( X \) is said to be \( \pi g \gamma \cdot T_2 \) if for each pair of distinct points \( x \) and \( y \) in \( X \), there exist \( U \in \pi G \gamma O(X, x) \) and \( V \in \pi G \gamma O(X, y) \) such that \( U \cap V = \emptyset \).

Theorem 4.3. Let \( X \) be a topological space. Suppose that for each pair of distinct points \( x_1 \) and \( x_2 \) in \( X \), there exists a function \( f \) of \( X \) into a Urysohn space \( Y \) such that \( f(x_1) \neq f(x_2) \). Moreover, let \( f \) be contra \( \pi g \gamma \)-continuous at \( x_1 \) and \( x_2 \). Then \( X \) is \( \pi g \gamma \cdot T_2 \).

Proof. Let \( x_1 \) and \( x_2 \) be any distinct points in \( X \). Then suppose that there exist an Urysohn space \( Y \) and a function \( f : X \rightarrow Y \) such that \( f(x_1) \neq f(x_2) \) and \( f \) is contra \( \pi g \gamma \)-continuous at \( x_1 \) and \( x_2 \). Let \( w = f(x_1) \) and \( z = f(x_2) \). Then \( w \neq z \). Since \( Y \) is Urysohn, there exist open sets \( U \) and \( V \) containing \( w \) and \( z \), respectively such that \( cl(U) \cap cl(V) = \emptyset \). Since \( f \) is contra \( \pi g \gamma \)-continuous at \( x_1 \) and \( x_2 \), then there exist \( \pi g \gamma \)-open sets \( A \) and \( B \) containing \( x_1 \) and \( x_2 \), respectively such that \( f(A) \subseteq cl(U) \) and \( f(B) \subseteq cl(V) \). So we have \( A \cap B = \emptyset \) since \( cl(U) \cap cl(V) = \emptyset \). Hence, \( X \) is \( \pi g \gamma \cdot T_2 \).

Corollary 4.4. If \( f \) is a contra \( \pi g \gamma \)-continuous injection of a topological space \( X \) into a Urysohn space \( Y \), then \( X \) is \( \pi g \gamma \cdot T_2 \).

Proof. For each pair of distinct points \( x_1 \) and \( x_2 \) in \( X \) and \( f \) is contra \( \pi g \gamma \)-continuous function of \( X \) into a Urysohn space \( Y \) such that \( f(x_1) \neq f(x_2) \) because \( f \) is injective. Hence by Theorem 4.3, \( X \) is \( \pi g \gamma \cdot T_2 \).  \[ \square \]
Definition 4.5. A space \((X, \tau)\) is said to be \(\pi g\gamma\)-connected if \(X\) cannot be expressed as the disjoint union of two non-empty \(\pi g\gamma\)-open sets.

Remark 4.6. Every \(\pi g\gamma\)-connected space is connected.

Theorem 4.7. For a space \(X\), the following are equivalent:

1. \(X\) is \(\pi g\gamma\)-connected;
2. The only subsets of \(X\) which are both \(\pi g\gamma\)-open and \(\pi g\gamma\)-closed are the empty set \(\emptyset\) and \(X\);
3. Each contra \(\pi g\gamma\)-continuous function of \(X\) into a discrete space \(Y\) with at least two points is a constant function.

Proof. (1)\(\Rightarrow\)(2): Suppose \(S \subset X\) is a proper subset which is both \(\pi g\gamma\)-open and \(\pi g\gamma\)-closed. Then its complement \(X-S\) is also \(\pi g\gamma\)-open and \(\pi g\gamma\)-closed. Then \(X = S \cup (X-S)\), a disjoint union of two non-empty \(\pi g\gamma\)-open sets which contradicts the fact that \(X\) is \(\pi g\gamma\)-connected. Hence, \(S = \emptyset\) or \(X\).

(2)\(\Rightarrow\)(1): Suppose \(X = A \cup B\) where \(A \cap B = \emptyset\), \(A \neq \emptyset\), \(B \neq \emptyset\) and \(A\) and \(B\) are \(\pi g\gamma\)-open. Since \(A = X-B\), \(A\) is \(\pi g\gamma\)-closed. But by assumption \(A = \emptyset\) or \(X\), which is a contradiction. Hence (1) holds.

(2)\(\Rightarrow\)(3): Let \(f : X \to Y\) be contra \(\pi g\gamma\)-continuous function where \(Y\) is a discrete space with at least two points. Then \(f^{-1}(\{y\})\) is \(\pi g\gamma\)-closed and \(\pi g\gamma\)-open for each \(y \in Y\) and \(X = \bigcup \{f^{-1}(\{y\}) : y \in Y\}\). By hypothesis, \(f^{-1}(\{y\}) = \emptyset\) or \(X\). If \(f^{-1}(\{y\}) = \emptyset\) for all \(y \in Y\), then \(f\) is not a function. Also there cannot exist more than one \(y \in Y\) such that \(f^{-1}(\{y\}) = X\). Hence there exists only one \(y \in Y\) such that \(f^{-1}(\{y\}) = X\) and \(f^{-1}(\{y_1\}) = \emptyset\) where \(y \neq y_1 \in Y\). This shows that \(f\) is a constant function.

(3)\(\Rightarrow\)(2): Let \(P\) be a non-empty set which is both \(\pi g\gamma\)-open and \(\pi g\gamma\)-closed in \(X\). Suppose \(f : X \to Y\) is a contra \(\pi g\gamma\)-continuous function defined by \(f(P) = \{a\}\) and \(f(X-P) = \{b\}\) where \(a \neq b\) and \(a, b \in Y\). By hypothesis, \(f\) is constant. Therefore \(P = X\). \(\square\)

Definition 4.8. A subset \(A\) of a space \((X, \tau)\) is said to be \(\pi g\gamma\)-clopen if \(A\) is both \(\pi g\gamma\)-open and \(\pi g\gamma\)-closed.

Theorem 4.9. If \(f\) is a contra \(\pi g\gamma\)-continuous function from a \(\pi g\gamma\)-connected space \(X\) onto any space \(Y\), then \(Y\) is not a discrete space.

Proof. Suppose that \(Y\) is discrete. Let \(A\) be a proper non-empty open and closed subset of \(Y\). Then \(f^{-1}(A)\) is a proper non-empty \(\pi g\gamma\)-clopen subset of \(X\) which is a contradiction to the fact that \(X\) is \(\pi g\gamma\)-connected. \(\square\)

Theorem 4.10. If \(f : X \to Y\) is a contra \(\pi g\gamma\)-continuous surjection and \(X\) is \(\pi g\gamma\)-connected, then \(Y\) is connected.

Proof. Suppose that \(Y\) is not a connected space. There exist non-empty disjoint open sets \(U_1\) and \(U_2\) such that \(Y = U_1 \cup U_2\). Therefore \(U_1\) and \(U_2\) are clopen in \(Y\). Since \(f\) is contra
\(\pi g\gamma\)-continuous, \(f^{-1}(U_1)\) and \(f^{-1}(U_2)\) are \(\pi g\gamma\)-open in \(X\). Moreover, \(f^{-1}(U_1)\) and \(f^{-1}(U_2)\) are non-empty disjoint and \(X = f^{-1}(U_1) \cap f^{-1}(U_2)\). This shows that \(X\) is not \(\pi g\gamma\)-connected. This contradicts that \(Y\) is not connected assumed. Hence \(Y\) is connected.

**Definition 4.11.** The graph \(G(f)\) of a function \(f : X \rightarrow Y\) is said to be contra \(\pi g\gamma\)-graph if for each \((x, y) \in (X \times Y) \setminus G(f)\), there exist a \(\pi g\gamma\)-open set \(U\) in \(X\) containing \(x\) and a closed set \(V\) in \(Y\) containing \(y\) such that \((U \times V) \cap G(f) = \emptyset\).

**Lemma 4.12.** A graph \(G(f)\) of a function \(f : X \rightarrow Y\) is contra \(\pi g\gamma\)-graph in \(X \times Y\) if and only if for each \((x, y) \in (X \times Y) \setminus G(f)\), there exist a \(U \in \pi G\gamma O(X)\) containing \(x\) and \(V \in C(Y)\) containing \(y\) such that \(f(U) \cap V = \emptyset\).

**Theorem 4.13.** If \(f : X \rightarrow Y\) is contra \(\pi g\gamma\)-continuous and \(Y\) is Urysohn, \(G(f)\) is contra \(\pi g\gamma\)-graph in \(X \times Y\).

**Proof.** Let \((x, y) \in (X \times Y) \setminus G(f)\). It follows that \(f(x) \neq y\). Since \(Y\) is Urysohn, there exist open sets \(V\) and \(W\) such that \(f(x) \in V\), \(y \in W\) and \(\text{cl}(V) \cap \text{cl}(W) = \emptyset\). Since \(f\) is contra \(\pi g\gamma\)-continuous, there exist a \(U \in \pi G\gamma O(X, x)\) such that \(f(U) \subseteq \text{cl}(V)\) and \(f(U) \cap \text{cl}(W) = \emptyset\). Hence \(G(f)\) is contra \(\pi g\gamma\)-graph in \(X \times Y\).

**Theorem 4.14.** Let \(f : X \rightarrow Y\) be a function and \(g : X \rightarrow X \times Y\) the graph function of \(f\), defined by \(g(x) = (x, f(x))\) for every \(x \in X\). If \(g\) is contra \(\pi g\gamma\)-continuous, then \(f\) is contra \(\pi g\gamma\)-continuous.

**Proof.** Let \(U\) be an open set in \(Y\), then \(X \times U\) is an open set in \(X \times Y\). It follows that \(f^{-1}(U) = g^{-1}(X \times U) \subseteq \pi G\gamma C(X)\). Thus \(f\) is contra \(\pi g\gamma\)-continuous.

**Definition 4.15.** A space \((X, \tau)\) is said to be submaximal [6] if every dense subset of \(X\) is open in \(X\) and extremally disconnected [26] if the closure of every open set is open.

Note that \((X, \tau)\) is submaximal and extremally disconnected if and only if every \(\beta\)-open set in \(X\) is open [17].

Note that \((X, \tau)\) is submaximal and extremally disconnected if and only if every \(\gamma\)-open set in \(X\) is open (we know that \(\gamma\)-open set is \(\beta\)-open) [29].

**Theorem 4.16.** If \(A\) and \(B\) are \(\pi g\gamma\)-closed sets in submaximal and extremally disconnected space \((X, \tau)\), then \(A \cup B\) is \(\pi g\gamma\)-closed.

**Proof.** Let \(A \cup B \subseteq U\) and \(U\) be \(\pi\)-open in \((X, \tau)\). Since \(A, B \subseteq U\) and \(A\) and \(B\) are \(\pi g\gamma\)-closed, \(\gamma \text{cl}(A) \subseteq U\) and \(\gamma \text{cl}(B) \subseteq U\). Since \((X, \tau)\) is submaximal and extremally disconnected, \(\gamma \text{cl}(F) = \text{cl}(F)\) for any set \(F \subseteq X\). Now \(\gamma \text{cl}(A \cup B) = \gamma \text{cl}(A) \cup \gamma \text{cl}(B) \subseteq U\). Hence \(A \cup B\) is \(\pi g\gamma\)-closed.

**Lemma 4.17.** Let \((X, \tau)\) be a topological space. If \(U, V \in \pi G\gamma O(X)\) and \(X\) is submaximal and extremally disconnected space, then \(U \cap V \in \pi G\gamma O(X)\).

**Proof.** Let \(U, V \in \pi G\gamma O(X)\). We have \(X \setminus U, X \setminus V \in \pi G\gamma C(X)\). By Theorem 4.16, \((X \setminus U) \cup (X \setminus V) = X \setminus (U \cap V) \in \pi G\gamma O(X)\).
(X \setminus V) = X \setminus (U \cap V) \in \pi G_\gamma C(X). \quad \text{Thus, } U \cap V \in \pi G_\gamma O(X). \hfill \square

**Theorem 4.18.** If \( f : X \to Y \) and \( g : X \to Y \) are contra \( \pi g_\gamma \)-continuous, \( X \) is submaximal and extremally disconnected and \( Y \) is Urysohn, then \( K = \{ x \in X : f(x) = g(x) \} \) is \( \pi g_\gamma \)-closed in \( X \).

**Proof.** Let \( x \in X \setminus K \). Then \( f(x) \neq g(x) \). Since \( Y \) is Urysohn, there exist open sets \( U \) and \( V \) such that \( f(x) \in U \), \( g(x) \in V \) and \( \text{cl}(U) \cap \text{cl}(V) = \emptyset \). Since \( f \) and \( g \) are contra \( \pi g_\gamma \)-continuous, \( f^{-1}(\text{cl}(U)) \in \pi G_\gamma O(X) \) and \( g^{-1}(\text{cl}(V)) \in \pi G_\gamma O(X) \). Let \( A = f^{-1}(\text{cl}(U)) \) and \( B = g^{-1}(\text{cl}(V)) \). Then \( A \) and \( B \) contain \( x \). Set \( C = A \cap B \). \( C \) is \( \pi g_\gamma \)-open in \( X \). Hence \( f(C) \cap g(C) = \emptyset \) and \( x \notin \pi g_\gamma \text{-cl}(K) \). Thus \( K \) is \( \pi g_\gamma \)-closed in \( X \). \hfill \square

**Definition 4.19.** A subset \( A \) of a topological space \( X \) is said to be \( \pi g_\gamma \)-dense in \( X \) if \( \pi g_\gamma \)-cl\((A) = X \).

**Theorem 4.20.** Let \( f : X \to Y \) and \( g : X \to Y \) be contra \( \pi g_\gamma \)-continuous. If \( Y \) is Urysohn and \( f = g \) on a \( \pi g_\gamma \)-dense set \( A \subseteq X \), then \( f = g \) on \( X \).

**Proof.** Since \( f \) and \( g \) are contra \( \pi g_\gamma \)-continuous and \( Y \) is Urysohn, by Theorem 4.18, \( K = \{ x \in X : f(x) = g(x) \} \) is \( \pi g_\gamma \)-closed in \( X \). We have \( f = g \) on \( \pi g_\gamma \)-dense set \( A \subseteq X \). Since \( A \subseteq K \) and \( A \) is \( \pi g_\gamma \)-dense set in \( X \), then \( X = \pi g_\gamma \text{-cl}(A) \subseteq \pi g_\gamma \text{-cl}(K) = K \). Hence, \( f = g \) on \( X \). \hfill \square

**Definition 4.21.** A space \( X \) is said to be weakly Hausdroff [30] if each element of \( X \) is an intersection of regular closed sets.

**Theorem 4.22.** If \( f : X \to Y \) is a contra \( \pi g_\gamma \)-continuous injection and \( Y \) is weakly Hausdroff, then \( X \) is \( \pi g_\gamma \text{-T}_1 \).

**Proof.** Suppose that \( Y \) is weakly Hausdroff. For any distinct points \( x_1 \) and \( x_2 \) in \( X \), there exist regular closed sets \( U \) and \( V \) in \( Y \) such that \( f(x_1) \in U \), \( f(x_2) \notin U \), \( f(x_1) \notin V \) and \( f(x_2) \in V \). Since \( f \) is contra \( \pi g_\gamma \)-continuous, \( f^{-1}(U) \) and \( f^{-1}(V) \) are \( \pi g_\gamma \)-open subsets of \( X \) such that \( x_1 \in f^{-1}(U) \), \( x_2 \notin f^{-1}(U) \), \( x_1 \notin f^{-1}(V) \) and \( x_2 \in f^{-1}(V) \). This shows that \( X \) is \( \pi g_\gamma \text{-T}_1 \). \hfill \square

**Theorem 4.23.** Let \( f : X \to Y \) have a contra \( \pi g_\gamma \)-graph. If \( f \) is injective, then \( X \) is \( \pi g_\gamma \text{-T}_1 \).

**Proof.** Let \( x_1 \) and \( x_2 \) be any two distinct points of \( X \). Then, we have \( (x_1, f(x_2)) \in (X \times Y) \setminus G(f) \). Then, there exist a \( \pi g_\gamma \)-open set \( U \) in \( X \) containing \( x_1 \) and \( F \in C(Y, f(x_2)) \) such that \( f(U) \cap F = \emptyset \). Hence \( U \cap f^{-1}(F) = \emptyset \). Therefore, we have \( x_2 \notin U \). This implies that \( X \) is \( \pi g_\gamma \text{-T}_1 \). \hfill \square

**Definition 4.24.** A topological space \( X \) is said to be Ultra Hausdroff [32] if for each pair of distinct points \( x \) and \( y \) in \( X \), there exist clopen sets \( A \) and \( B \) containing \( x \) and \( y \), respectively such that \( A \cap B = \emptyset \).

**Theorem 4.25.** Let \( f : X \to Y \) be a contra \( \pi g_\gamma \)-continuous injection. If \( Y \) is an Ultra Hausdroff space, then \( X \) is \( \pi g_\gamma \text{-T}_2 \).
Proof. Let \( x_1 \) and \( x_2 \) be any distinct points in \( X \), then \( f(x_1) \neq f(x_2) \) and there exist clopen sets \( U \) and \( V \) containing \( f(x_1) \) and \( f(x_2) \) respectively, such that \( U \cap V = \emptyset \). Since \( f \) is contra \( \pi g \gamma \)-continuous, then \( f^{-1}(U) \in \pi G \gamma O(X) \) and \( f^{-1}(V) \in \pi G \gamma O(X) \) such that \( f^{-1}(U) \cap f^{-1}(V) = \emptyset \). Hence, \( X \) is \( \pi g \gamma -T_2 \).

**Definition 4.26.** A topological space \( X \) is said to be

1. \( \pi g \gamma \)-normal if each pair of non-empty disjoint closed sets can be separated by disjoint \( \pi g \gamma \)-open sets.
2. Ultra normal [32] if for each pair of non-empty disjoint closed sets can be separated by disjoint clopen sets.

**Theorem 4.27.** If \( f : X \to Y \) is a contra \( \pi g \gamma \)-continuous, closed injection and \( Y \) is Ultra normal, then \( X \) is \( \pi g \gamma \)-normal.

Proof. Let \( F_1 \) and \( F_2 \) be disjoint closed subsets of \( X \). Since \( f \) is closed and injective, \( f(F_1) \) and \( f(F_2) \) are disjoint closed subsets of \( Y \). Since \( Y \) is Ultra normal, \( f(F_1) \) and \( f(F_2) \) are separated by disjoint clopen sets \( V_1 \) and \( V_2 \), respectively. Hence \( F_i \subseteq f^{-1}(V_i) \), \( f^{-1}(V_i) \in \pi G \gamma O(X, x) \) for \( i = 1, 2 \) and \( f^{-1}(V_1) \cap f^{-1}(V_2) = \emptyset \) and thus \( X \) is \( \pi g \gamma \)-normal.

## 5. Conclusion

Topology as a field of mathematics is concerned with all questions directly or indirectly related to open/closed sets. Therefore, generalization of open/closed sets is one of the most important subjects in topology.

Topology plays a significant role in quantum physics, high energy physics and superstring theory. Moreover, some notions of the sets and functions in topological spaces and ideal topological spaces are highly developed and used extensively in many practical and engineering problems. In this paper, we introduced and investigated the notion of contra \( \pi g \gamma \)-continuous functions by utilizing \( \pi g \gamma \)-closed sets [31]. We obtained fundamental properties of contra \( \pi g \gamma \)-continuous functions and discussed the relationships between contra \( \pi g \gamma \)-continuity and other related functions.
